## La démence, qu'est ce que c'est ?

### Définition générale

La démence est un trouble neurocognitif qui se caractérise par des déficits cognitifs divers variant en fonction du type de démence (définis par leur cause). La maladie d'Alzheimer est le type de démence le plus fréquent.

Il arrive à chacun d'entre nous de commettre des erreurs ou des étourderies. Il peut arriver que l'on oublie ou l'on a bien pu déposer un objet ou un autre ou que nous avons déjà raconter la même histoire à un de nos proches.

Ces comportements peuvent généralement être expliqués par une saturation d'informations due à nos modes de vie actifs et stressants et ne sont bien souvent pas des signes de démence. Plus les gens vieillissent, plus la
